

# **In Arthritis and Rheumatoid Conditions Generally**

Medical evidence has shown that 'Calsiod' deserves a thorough trial in arthritis and rheumatoid conditions generally. A great number of arthritics have been permanently benefited by the drug, and it has proved of genuine service in those ill-defined conditions loosely grouped under such terms as 'fibrositis,' 'myalgia,' 'neuralgia,' and 'lumbago.'

Although alleviation of pain may follow the use of 'Calsiod' in a relatively short time, the best end-results are obtained by continuing treatment for at least a month.

'Calsiod' contains the calcium salt of ortho-iodoxybenzoic acid, which has a marked bactericidal action in the blood-stream, stimulates leucocytosis, increases the lymph-flow, exerts a prompt analgesic effect, decreases muscle spasm, and reduces swelling.
