

incidence, but a consequence of postponed onset due to the immunosuppressive properties of pregnancy. More research is needed to study these issues in arthritic and other autoimmune diseases.

In summary, the proportion of incident cases with onset 0–24 months after delivery, were not different for RA and OCA. A peak in onset of disease 0–24 months versus 25–48 months post partum was seen overall and in the RA group, both for the total number of pregnancies and for diagnosis after the first pregnancy.

Funding: Research grants for the NOR-DMARD register have been received from Abbott, Amgen, Aventis, BMS, MSD, Roche, Schering-Plough/Centocor, Wyeth and the Norwegian Directorate for Health and Social Affairs. This actual work was supported by the liaison committee between the Central Norway Regional Health Authority (RHA) and the Norwegian University of Science and Technology (NTNU).

Competing interests: Hans Bijlsma was the Handling Editor for this article.

Ethics approval: Approval from the regional ethic committee of Central Norway.

Provenance and peer review: Not commissioned; externally peer reviewed.
