Results In RA synovial tissue expression of FoxO1 negatively correlated with clinical parameters of disease activity: serum C-reactive protein ($R = -0.771, P = 0.0008$), erythrocyte sedimentation rate ($R = -0.759, P = 0.0003$), and DAS28 ($R = -0.575, P = 0.01$), as well as synovial IL-6 mRNA levels ($R = -0.628, P = 0.004$). In vitro, RA FLS stimulation with IL-1β or TNFα caused rapid down-regulation of FoxO1 mRNA levels, followed by reduction of FoxO1 protein expression and DNA binding. This effect was independent of PKB signalling, and was associated with acceleration of FoxO1 mRNA degradation in the presence of IL-1β. Inhibition of c-Jun N-terminal kinase (JNK), but not other MAPKs, prevented down-regulation of FoxO1 expression and binding by IL-1β, and blocked IL-1β-induced reduction of FoxO1 mRNA stability. Overexpression of constitutively active FoxO1 in RA FLS induced apoptosis associated with altered expression of genes regulating cell cycle and apoptosis: BIM and p27Kip1 were induced while expression of Bcl-XL was suppressed in cells expressing active FoxO1.

Conclusions Collectively, our findings suggest that suppressed synovial FoxO1 expression is strongly associated with RA pathology and demonstrate that reduction of FoxO1 expression might contribute to perpetuation of inflammation in RA by promoting FLS survival and proliferation. Our data also identify JNK-mediated modulation of FoxO1 mRNA stability as an important mechanism underlyng regulation of FoxO1 by inflammatory cytokines.

A10.17 INTERLEUKIN-36α IS EXPRESSED BY SYNOVIAL PLASMA CELLS AND INDUCES CYTOKINE PRODUCTION IN HUMAN FIBROBLASTS

doi:10.1136/annrheumdis-2013-203224.17

Background and Objectives The interleukin (IL)-36 family is a recently described member of the IL-1 cytokine family with pro-inflammatory and clearly pathogenic properties in psoriasis arthritis (PsA). The majority of patients with PsA and rheumatoid arthritis (RA) benefit from cytokine blocking therapies targeting TNFα, however, despite novel developments, subgroups of patients do not respond to this therapy. Therefore it is necessary to get a better understanding of the pathogenesis of synovitis in PsA and RA to learn more about the complex cellular interplay and to develop new treatment approaches. Therefore, we wanted to determine the IL-36α expression in PsA compared to RA and osteoarthritis (OA).

Materials and Methods Synovial tissue obtained from arthritis patients were stained for IL-36α, IL-36 receptor (IL-36R) and IL-36R antagonist (IL-36Ra) by immunohistochemistry and immunofluorescence. Lysates were tested for IL-36α by immunoblotting. Synovial fibroblasts (FLS) cultured in the presence of IL-36α were assessed for cytokine expression by quantitative real time PCR and Multiplex assay. IL-36α-induced signal transduction in FLS was analysed by immunoblotting.

Results The IL-36R and its ligands IL-36α and IL-36Ra could be detected in inflammatory arthritis in the synovial lining layer as well as cellular infiltrates. IL-36α was significantly higher expressed in PsA and RA synovium compared to OA ($p = 0.0001$, and $p < 0.0001$, respectively). No differences were seen in IL-36R and IL-36Ra. The expression of IL-36α was confirmed by western blot analysis. IL-36α induced expression of IL-6 and IL-8 in FLS. CD138-positive plasma cells were defined as a major cellular source for IL-36α. Functionally, IL-36α induced the expression of IL-6 and IL-8 in FLS through NF-κB/p38-activation.

Conclusions Here, we describe that the novel cytokine IL-36α, mainly expressed by plasma cells, is upregulated in PsA and RA synovium and leads to IL-6 and IL-8 production by synovial fibroblasts. This finding needs further studies to determine if the IL-36 family can function as a potential target for arthritis therapy.

A10.18 LACK OF ASSOCIATION OF SERUM INTERLEUKIN-17 AND INTERLEUKIN-23 LEVELS WITH DISEASE ACTIVITY IN PATIENTS WITH ANKYLOSING SPONDYLITIS IN LATVIA

doi:10.1136/annrheumdis-2013-203224.18

1Zepa Julia, 1Bulina Inita, 2Nikitina-Zahe Lieke, 2Klokins Janis, 1 Jurka Anita, 1Tretjakovs Peteris, 2Lejnieks Andris, 1Andersone Daina. 1Pauls Stradins Clinical University Hospital; 2Riga Stradins University; 4Biomedical Research and Study Centre of Latvia; 4Riga East Clinical University hospital; 5University of Latvia, Latvia

Background Ankylosing spondylitis (AS) is a clinically well-known chronic inflammatory disease of the axial skeleton and peripheral joints. The pathogenesis of this disease still remains a challenge. Determination of cytokine profile and its role involved in AS pathogenesis give an opportunity to extend the targeted therapeutic approach. Interleukin-17 (IL-17) and interleukin-23 (IL-23) are cytokines of interest in the investigation of the pathogenesis of spondyloarthritides although their importance in AS is not clearly defined.

Objectives to investigate levels of IL-17 and IL-23 in a group of AS and in a demographically matched group of healthy subjects and its association with the disease activity measured by relevant clinical and biochemical parameters.

Materials and Methods 39 AS patients classified by the modified New York and ASAS criteria were assessed clinically and 6 ml of serum were collected from each patient. 39 healthy subjects as control group were included in this study. The serum IL-17 and IL-23 levels were tested using xMAP multiplex immunobead assay technology. At the same time the disease activity was measured by using Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) and Ankylosing Spondylitis Disease Activity Score (ASDAS) using C-reactive protein (CRP), erythrocyte sedimentation rate (ESR).

Results The mean serum IL-17 and IL-23 level in AS group was respectively 18.9 (SD 39.6) and 194.6 (SD 261.4) pg/ml. In the healthy control group the mean serum IL-17 level was 15.4 (SD 26.0) and IL-23 level = 200.3 (SD 256.3) pg/ml. The serum levels of IL-17 and IL-23 were not statistically significantly different from the healthy subjects and the levels did not correlate with the disease activity measured by BASDAI and ASDAS (using the CRP and ESR).

Conclusions These results suggest that IL-17 and IL-23 are not major components of the pathogenesis of inflammation in AS patients. Our data differ from Cheew W S et al, in 2012 published data of the serum IL-17 and IL-23 level association with the disease activity in Chinese patients with AS. This difference is probably due to the various genetic aspects characterising AS as geographically matched disease.

A10.19 MRP8/14 SERUM COMPLEXES AS PREDICTOR OF RESPONSE TO BIOLOGICAL TREATMENTS IN RHEUMATOID ARTHRITIS

1Yuen Kai Choi, 1Marike J Herenius, 1Carla A Wijbrandts, 2Johannes Roth, 2Dirk Föll, 3Danielle M Gerlag, 2Paul-Peter Tak, 2Dirk Holzinger. 1Division of Clinical Immunology and Rheumatology, Academic Medical Center/University of Amsterdam, The Netherlands; 2Institute of Immunology, University Hospital Muenster, Muenster, Germany; 3GlaxoSmithKline, Stevenage, UK; 4Department of General Paediatrics, University Children’s Hospital Muenster, Muenster, Germany

Background and Objectives Biological therapy has dramatically improved the treatment of rheumatoid arthritis (RA). One-third of
