Background: In advanced ankylosing spondylitis (AS), bone ankylosis or ossification of the involved joints can make the chest practically immobile, decrease its compliance, or even lead to intercostal muscle atrophy.

Objectives: The purpose of the study was to evaluate chest involvement in AS by measuring toracoabdominal movements during quiet breathing, by dividing the chest and abdominal contribution to the current volume, by inductive plethysmography methods.

Methods: 60 consecutive patients were recruited from the Rheumatology Department of the Republican Clinical Hospital. They were selected based on AS diagnosis, with no existing cardiovascular or neuromuscular diseases that would alter respiratory mechanisms and the absence of severe obesity.

Results: Monotherapy with DMARD was 27 out of 60 patients (45%) (Sulfasalazine 3 g/day) for a period of 1–48 months (mean value=19.4 (15.5) months).

There were no differences in the angle of the Ct-Abd curve between patients with DMARD and DMARD-naive treatment (39.2 (14.5)° and 34.7 (19.5)° for sitting position, 49.3 (18.1)° and 47.2 (23.1)° in orthostatism, and 19.1 (15.6)° and 16.1 (14.6)° for clinoabdominal measurements, p<0.05). In the baseline study, the Ct-Abd patient angle was lower than the control group in sitting position (36.3 (17.3)° and 51.5 (8.9)°, p<0.0002) in orthostatism (48.1 (20.8)° and 62.4 (12.5)°, p<0.01) or orthostatism (17.4 (15.0)° and 24.5 (9.8)°, p<0.05). In the entire patient group, the Ct-Abd angle correlated negatively with CRP/BASFI in all three body positions (r=−0.50, p<0.001 in the sitting position, r=−0.36, p<0.01 in orthostatism, r=−0.47, p<0.001 in clinoabdominal measurements); did not correlate with BASDAI, BASMI, or the modified Schoeber test in either of the three body positions.

In 15 AS patients who underwent repeated measurements of toracoabdominal movements while receiving their associated DMARD treatment (Methotrexate 15 mg/week and Sulfasalazine 3 g/day) 3 months treatment, the angle of the Ct-Abd slope was significantly higher than that of the fundamental study, in all body positions.

The Ct-Abd angle continued to increase, with increments less pronounces and statistically lower boundaries of 6.6° and 8.2°.

Conclusions: The slope of the Ct–Abd curve during quiet breathing correlates negatively with BASFI and responds significantly to associated DMARD treatment and NSAIDs.

Our data suggest that this measure can be targeted for further evaluation of its usefulness in monitoring chest involvement and its response to treatment in AS patients.

AB0833 REAL-WORLD EFFICACY AND SAFETY OF SECUKINUMAB: DATA FROM VERONA’S COHORT

F. Martins, C. Caimmi, A. Carletto, E. Fracassi, M.Rossini, Rheumatology, AOUI Verona, Verona, Italy

Background: Secukinumab has been approved for the treatment of active ankylosing spondylitis (AS) and psoriatic arthritis (PsA). Its efficacy has been demonstrated in phase III trials where eligibility criteria ensured a homogeneous population. Although this strategy reduces confounding factors, it does not guarantee the same results in the real world, where clinicians deal with advanced disease, comorbidities, adherence and persistence challenges.

Objectives: Aim of this study was to assess efficacy and safety of Secukinumab in real-world clinical practice.

Methods: Patients received Secukinumab (150 or 300 mg) at weeks 0, 1, 2, and 3 as induction therapy and then every 4 weeks as maintenance therapy. Assessment of disease activity was done at months 0, 6 and 12 using DAPSA, ASDAS, BASDAI, ESR, and CRP. The efficacy comparison between ETN and ADA showed ETN superiority concerning BASDAI (p = 0.03 vs 1.9; p=0.004) and ASDAS CRP (-3.03 vs -1.4; p=0.006). The comparison ADA vs IFX had shown no significant efficacy differences.

Conclusions: Our results showed a BASDAI 50 response in 62% of patients. The comparison between the three biologics was consistent with a better efficacy of the ETN.

AB0832 THE EFFECTS OF ANTI-TNF BIOLOGICAL AGENTS IN PATIENTS WITH SPONDYLOARTHRITIS: A COMPARATIVE STUDY

F. Essati, O. Saidane, I. Mahmoud, A. Ben Tekaya, R. Tekaya, L. Abdelmoula. Rheumatology, Charles Nicolle Hospital, Tunis, Tunisia

Objectives: The aim of the present study was to compare the efficacy of three anti-TNF agents (adalimumab, infliximab and etanercept) in patients with spondyloarthritis (SpA).

Methods: We achieved a retrospective descriptive and comparative monocentric study, on 49 patients, with SpA including ankylosing spondylitis (AS), psoriatic arthritis (PsA), enteropathic arthritis (EA), reactive arthritis (ReA) and undifferentiated spondyloarthritis (uSpA) (according to Amor criteria, ASAS 2009 and CASPAR criteria), during 12 years (2004–2016). The patients were treated with at least one anti-TNF, during at least 6 months. Disease activity was assessed by the BASDAI, ASDAS, ESR and CRP. To compare mean differences between time points (week 0 versus week 24), a Wilcoxon test was applied. To compare efficacy between the 3 anti-TNF, a Mann-Whitney test was applied.

Results: Twenty three patients (47%) had AS, 13 patients (27%) had PsA and 11 patients (22%) had EA. One patient had an uSpA, and 1 patient had a ReA. The mean age was 42,81 years±11.77. The median age at disease onset was 29,41 years±11.29. The mean disease duration was 10,16 years. Nineteen patients received etanercept (ETN), 18 infliximab (IFX) and 12 adalimumab (ADA).

At six months, the 3 anti-TNF showed improvement in the disease activity scores: BASDAI (p<0.0001), ASDAS CRP (p<0.0001), ESR (p<0.0001) and CRP (p<0.0001). Sixty two percent of the patients have reached BASDAI 50 response at 6 months.

BASDAI: Bath Ankylosing Spondylitis Disease Activity Index, ASDAS: Ankylosing Spondylitis Disease Activity Score, C-Reactive protein, ESR: Erythrocyte Sedimentation Rate.

At week 24, patients on ETN achieved more frequently a significant reduction of BASDAI (−5.13 vs −2.53; p=0.004), ESR (−52.69 vs −16.84; p=0.006) and CRP (−2.04 vs −1.34; p=0.000) than IFX and ADA. The efficacy comparison between ETN and ADA showed ETN superiority concerning BASDAI (−5.13 vs −2.04; p=0.004) and ASDAS CRP (−3.03 vs −1.4; p=0.006). The comparison ADA vs IFX had shown no significant efficacy differences.

Conclusions: Our results showed a BASDAI 50 response in 62% of patients. The comparison between the three biologics was consistent with a better efficacy of the ETN.
