buckers for primary and secondary OA, respectively, when compared with healthy individuals. TNP-α is a suitable biomarker for the diagnosis of both primary and secondary OA when compared to SLE patients, whereas IL-6 and IL-1β were apparent explicit markers of primary OA, while IL-10 was exclusive for secondary OA.

Abstract AB1379 – Table 1. The values obtained from the ROC curves for the cytokine panel and NOx for patients clinically diagnosed with primary and secondary osteoarthritis against normal healthy controls.

*For the cytokines, in pg/ml and for NOx in μmol/L

Conclusions: This preliminary study suggests that higher levels of inflammatory cytokines are present in secondary OA compared to primary OA. Furthermore, different markers for primary and secondary OA were identified, indicative of the potential for developing different therapeutic agents for the different types of OA.

AB1380 PERIPHERAL NEUROPATHY IN INFLAMMATORY JOINT DISEASES

Y. Yehudina, O. Syniachenko, T. Bevzenko. Internal Medicine, Dnepropetrovsk Medical Academy.

Background: For frequent extra-articular (systemic) manifestations of joints inflammatory diseases are various damages of the nervous system and the severe and severity of peripheral neuropathy (PNP) have significance in the clinical course, which incidence among these patients is 5%—10%. Nevertheless, many clinical and pathogenic aspects of this peripheral neuropathy (PNP) remain obscure.

Objectives: To evaluate the rate and clinical features of PNP in rheumatoid arthritis (RA), chlamydia urogenital reactive arthritis (ReA), psoriatic arthritis (PA) and ankylosing spondylitis (AS), to examine the issues of pathogenetic constructions such changes of the nervous system, define risk factors.

Methods: The study included 416 patients with inflammatory joint diseases, among them 131 RA patients, 101 ReA, 76 PA and 108 AS. The average age of the examined was respectively 45, 32, 42 and 38 years, disease duration – 10, 4, 12 and 11 years, male to female ratio – 1:5, 1:1, 1:2 and 10:1.

Results: The frequency of the PNP in RA, ReA, PA and AS was respectively 13%, 19%, 24% and 34%, while its severity in patients with PA > ReA > RA > AS, and the same type ratio of motor, sensory and mixed disorders of inflammatory joint diseases, trophic, visceral and vascular vegetative changes, the connexion with the male sex, the activity of arthritis and the presence of tendovaginitis, participation of immune disorders, endothelial dysfunction of blood vessels and changes in physical and chemical rheological viscoelastic properties of blood in the pathogenesis constructions of the nervous system lesions are united around. RA and PA are different by frequency of hands and feet distal pathology, the AS – by the beginnings of tunnel syndrome. RA tends to impact on the PNP digital arthritis, myositis, eye disease, and Sjogren’s syndrome, ReA – on sacroiliitis, PA – on exudative form of cutaneous psoriasis, AS – on eye disease, at that, the risk factors for severe course of neuropathy in RA is considered to involve in the process of elobos, ReA – intervertebral and facet joints, PA – wrist, AS – sacroiliac. Guillain-Barré syndrome develops respectively in 3%, 4%, 5% and 9% of patients with RA, PA, ReA and AS, or in 24%, 17%, 26% and 27% cases of PNP, which is closely linked to the presence of tendovaginitis in all inflammatory diseases and severity of articular involvement, in RA it depends on the presence of hypothroidism, in ReA – on nephropathy and violations of the heart’s electrical conduction, in AS – on osteoporosis, and serosperos for anti-cyclic cullinated peptide antibody is a risk factor for such peripheral nervous system disorders.

Conclusions: PNP is a relatively common manifestation of inflammatory diseases of the joints, which correlate with clinical and laboratory signs of the disease, and in the future active detection of the nervous system pathology will be useful for timely follow-up rehabilitation.

AB1381 FOUR ANNUAL INTERNATIONAL DIFFERENT MEETINGS OF RHEUMATOLOGY: COMPARATION OF THE CONTENTS, ANALYSIS, CHALLENGE AND OPPORTUNITIES

Background: The medical meetings are a tool to help us be able to escalate and actualize the medical knowledge and their quality is a responsibility of Colleges and Institutions.

Objectives: To assess the academic level of four types of different annual Meeting of Rheumatology

Methods: We used as support information the summaries published in the supplements of the journal Reumatologia Clinica, SE1 Vol. 12 of February 2016, the supplement SE 1 Vol. 13 of February 2017, the application for electronic media of the ACR/ARPHP 2016 of the American Congress of Rheumatology 2016 and the website for abstracts of EULAR 2017 respectively dedicated to the surveys presented in the XLIV Mexican Congress of Rheumatology, XVL Mexican Congress of Rheumatology and the 2016 ACR/ARPHP Annual Meeting, and EULAR 2017 respectively, of each survey we was obtained information about of the diverse pathologies, the type of trial, content and population referred (adults versus children).

Results: 275, 340, 3275 and 4129 were presented in the XLIV Mexican Congress of Rheumatology, XVL Mexican Congress of Rheumatology, the 2016 ACR/ARPHP Annual Meeting and EULAR 2017 respectively. Rheumatoid arthritis (RA) was the most common pathology with 23%, 26%, 21% and 27% in CMR 44, CMR 45, ACR 2015 and EULAR 2017 respectively, followed by systemic lupus erythematosus, third place was vasculitis, beside in international congress was the spondyloarthritis. Highlighted, RA the items about of clinic manifestations were accounted for almost 30% in the Mexican congress and almost 20% in ACR and EULAR. Observational studies accounted for almost 40% in Mexican congresses vs. 33% in ACR 2016 and 55% in EULAR 2017 respectively, followed by basic research were minimal in Mexican congress, but in ACR 2016 accounted for 21% and 12% in EULAR 2016.

The trials about of Paediatric Rheumatology were 12.3%, 5.5% and 4.9% in CMR 44, CMR 45 and ACR 2016 respectively.

Abstract AB1381 – Figure 1. percentage of rheumatic disease

Conclusions: Rheumatology Meeting constitutes a support to obtain the adequate medical knowledge based in evidence, in this important branch of...
