Background: Only few longitudinal observational studies exist on the comparison of health-related quality of life (HRQoL) between PsA and RA patients using the Medical Outcomes Survey Short Form-36 (SF-36), as well as with general population controls.

Objectives: The aims were 1) to explore if improvements in SF-36 scale scores differ between PsA and RA patients, 2) to compare proportions of PsA and RA patients achieving Minimum Clinically Important Improvements (MCII) in scale scores at 6 months follow-up, 3) to compare HRQoL between RA, PsA patients and Norwegian general population controls.

Methods: We included first-time enrolled PsA and RA patients from the prospective observational multicenter NORWEGian-Disease Modifying Anti-Rheumatic Drug (NOR-DMARD) study, starting conventional synthetic and/or biologic (cs/b) DMARDs between year 2000 and, 2012 as well as data from Norwegian general population controls.2 Continuous variables were compared using independent t-test or Mann-Whitney U test as appropriate. Prespecified ANCOVA analyses adjusted for age and gender were performed to compare changes in scale scores from baseline to 6 months follow-up between PsA and RA patients. Radar diagram was made to visualise changes in scale scores (0 worst, 100 best) and bar charts to visualise improvements from baseline to 6 months as well as proportions of patients fulfilling MCII (≥5) in scale scores at 6 months.

Results: A total of 1515 PsA and 3898 RA patients as well as 2323 Norwegian general population controls2 were included (mean SD age 48.1 (12.6)/55.9 (31.6)/44.9 (16.5) years, 50.3%/71.4%/51.3% women, respectively; median (25th-75th percentile) disease duration RA; 2.0 (0.1–11.0) years). Mean (SD) DAS28 was lower in PsA vs. RA patients at baseline (4.2 (1.3)/5.2 (0.9), PsA: 1.9 (0.1–11.0) years). Mean (SD) BASDAI was lower in PsA vs. RA patients at baseline (4.2 (1.3)/4.9 (1.4) and at 6 months (3.1 (1.3)/3.5 (1.5)), as well as median (25th-75th percentile) 28 swollen joint count at baseline (2 (1–5)/6 (3–10)) and at 6 months (0 (0–2)/0 (0–4) follow-up, all p<0.001. All scale scores were worse in PsA and RA compared with the general population (p<0.001), but improved during cs/bDMARD treatment (figure 1a). The improvements were marginally better in RA versus PsA patients for bodily pain, vitality and mental health (figure 1b). Similar percentages of RA and PsA patients achieved MCII (≥5) in scale scores from baseline to 6 months follow-up. *p<0.002; **p<0.005

Conclusions: These findings indicate that PsA patients have at least as high disease burden in terms of HRQoL as RA patients, in spite of higher levels of joint inflammation in the RA patients. Improvements during treatment were overall similar, except for somewhat larger improvements in bodily pain, vitality and mental health in RA patients. Similar proportions of PsA and RA patients achieved MCII at 6 months.

THE IMPACT OF COMORBIDITIES ON PHYSICAL FUNCTION IN PATIENTS WITH ANKYLOSING SPONDYLITIS (AS) AND PSORIATIC ARTHRITIS (PSA) ATTENDING RHEUMATOLOGY CLINICS

Background: Regardless of disease activity, functional status gets worse in patients with rheumatoid arthritis (RA) with comorbidities. However, the impact of comorbidity on physical function in ankylosing spondylitis (AS) and psoriatic arthritis (PsA) is less known.

Objectives: To assess the impact of comorbidities on physical function (PF) in patients with AS and PsA.

Methods: Data from patients with AS and PsA were analysed. Two different adjusted multivariate models were performed, where PF was the dependent variable (BASFI in AS and HAQ in PsA) and the following independent variables: comorbidities, a proxy for the Charlson index (ChI) (minimum 0; maximum 11), sociodemographic, disease activity (ESR, CRP and BASDAI in AS; while SJC, TJC, CRP, ESP, DAS, dactylitis count and PASI in PsA) and duration, radiographic damage and treatments. Results are presented as β coefficients and p-values.

Results: 738 patients with AS and 721 with PsA included (mean age at inclusion 48.1±11.7 and 51.8±12 years, respectively). AS patients: median BASFI 3.1 (IQR: 1.3–5.2), BASDAI 5.0 (IQR: 1.7–5.3), mean Chl 1.32 ±0.73. PsA patients: HAQ 0.4 (IQR: 0.0–0.9), DAS28 2.9 (IQR: 2.0–3.8), mean Chl 1.30±0.66. A ChI >1 found in 21% of the patients. Hypertension in 25.7% and 29.5%; hypercholesterolemia in 27% and 35.6% and diabetes in 7.6% and 9.2% of the patients with AS and PsA, respectively. Cardiovascular events occurred in 7.6% AS and 7.2% PsA, in most cases after the rheumatic disease diagnosis. Only patients with PsA with higher ChI showed worse adjusted physical function (β: 0.09; p=0.03). Also female sex (β: 0.03; p=0.001), obesity (β: 0.09; p=0.04), disease duration (β: 0.01; p=0.009), NSAIDs (β: 0.1; p=0.02), corticosteroids (β: 0.12; p=0.02) and biologics (β: 0.15; p=0.07) were associated with worse function in patients with PsA. In contrast, a higher educational level was associated with less disability. In patients with AS, thyroid disease (β: 1.19, p=0.002) and raised ESR (β: 0.01, p=0.010) were independently associated with function.

Conclusions: The presence of comorbidities in patients with PsA is independently associated with worse physical function, similar to what happens in RA. Early detection and control may yield an integral management of the disease and better final outcomes.

Patients with Psoriatic Arthritis who are not eligible for randomised clinical trials for TNF inhibitors have similar treatment response and drug survival. Results from the Icebox Registry

Background: We have recently reported that a majority of patients with psoriatic arthritis who are being treated with TNF inhibitors in Iceland would not have been

PATIENTS WITH PSORIATIC ARTHRITIS WHO ARE NOT ELIGIBLE FOR RANDOMISED CLINICAL TRIALS FOR TNF INHIBITORS HAVE SIMILAR TREATMENT RESPONSE AND DRUG SURVIVAL. RESULTS FROM THE ICEBOX REGISTRY

Background: We have recently reported that a majority of patients with psoriatic arthritis who are being treated with TNF inhibitors in Iceland would not have been
eligible for the randomised clinical trials (RCTs) performed leading up to registration of the respective pharmaceutical product.

Objectives: To determine whether patients with psoriatic arthritis who did not fulfil the inclusion criteria (group B) in RCTs receive similar benefits and drug survival from TNF inhibitors as those patients who would have fulfilled the inclusion criteria (group A).

Methods: All patients with rheumatic disorders who are treated with biologic DMARDs in Iceland are registered in ICEBIO. ICEBIO is based on the Danish Registry for biologic therapies in rheumatology and has data about approximately 98% of all patients with psoriatic arthritis treated with biologic DMARDs in Iceland. On February 1st 2016 there was information on 1058 individuals in ICEBIO.231

There was similar drug survival between the groups (figure 1).

4.2). Out of 231 patients we have sufficient data to determine ACR20 and DAS28CRP response in 92 and 91 patients respectively. Treatment response is outlined in table 2, with better response in group A in regards to HAQ and SJC. The groups were similar at baseline (table 1), although Group A predictably had higher SJC (5.5 vs 3.8) and subsequently higher DAS28CRP (4.6 vs 4.2). Out of 231 patients we have sufficient data to determine ACR20 and DAS28CRP response in 92 and 91 patients respectively. Treatment response is outlined in table 2, with better response in group A in regards to HAQ and SJC. There was similar drug survival between the groups (figure 1).

Abstract THU0284 – Table 1. Group characteristics, mean values±SD.

Figure 1. First-line TNF inhibitors, mean values and percentage achieving response by ACR20 or decrease in disease activity by DAS28CRP.

Conclusions: Patients with psoriatic arthritis that would not have fulfilled the inclusion criteria in RCTs seem to respond to treatment effectively and have similar drug survival. Thus, treatment outcomes for psoriatic arthritis from RCTs may probably be applied to daily clinical practice, whether patients would have fulfilled RCT criterias or not. However, more detailed studies are needed.
