Comment on: 'Lupus Low Disease Activity State (LLDAS) attainment discriminates responders in a systemic lupus erythematosus trial: post-hoc analysis of the Phase IIb MUSE trial of anifrolumab' by Eric Morand *et al*

I read with great interest the paper by Eric Morand and colleagues¹ reporting on the utility of the Lupus Low Disease Activity State attainment using a useful form of discrimination in the phase IIb MUSE Anifrolumab trial published recently in the journal. The manuscript makes a useful contribution to this important debate but does contain one important error which should be corrected.

In the discussion, the authors state 'The assumption that gastrointestinal activity, which is not measured in the SLEDAI-2K or BILAG...' is simply incorrect. British Isles Lupus Assessment Group (BILAG)-2004² has a whole section dedicated to capturing gastrointestinal disease. It is one of several facets of lupus activity captured in BILAG but not captured in SLEDAI-2K (others include haemolytic anaemia and ophthalmic disease).
