Conclusion: Our study showed that there was no correlation between the clinical condition of patients and their follow-up imaging in the context of PVO. Clinical and biological evaluation seems sufficient to determine whether or not the patient is cured. Many images are made during the follow-up with a questionable cost-effectiveness ratio. A standard radiograph may be sufficient to provide a basic structural condition at the end of antibiotic therapy.

BRUCELLAR SPONDYLODISCITIS: CLINICAL, RADIOLOGICAL AND THERAPEUTIC FEATURES

Aicha Ben Tekaya1, Khouloua Zoussou1, Iines Mahmoud1, Oifa Saidane1, Mohamed Ben Hammania2, Rawdha Tekaya1, Leila Abdelmoula1, 1 Charles Nicolle Hospital, Tunis, Tunisia; 1Rafa hospital, Tunis, Tunisia

Background: Brucellosis is an endemic disease around the Mediterranean and especially in Tunisia and Brucellar spondylodiscitis is the most common osteoarticular localization.

Objectives: The aim of our study is to study the clinical, radiological and therapeutic characteristics of Brucellar spondylodiscitis.

Methods: This is a retrospective descriptive study, conducted over 20 years (1999-2019) at a Rheumatology Department. We collected cases of Brucellar spondylodiscitis. We studied the clinical, radiological features and therapeutic outcomes.

Results: We included 23 patients, 15 men and 8 women, with a mean age of 53.21 years [31.79]. Contact with livestock or consumption of raw milk was noted in 16 cases. The diagnosis time was, on average, 3.8 months [1.9]. Spine pain was present in all cases, with lumbar seat in 16 cases and was inflammatory in 20 cases. At the examination, 19 patients had a limitation of spinal mobility and 4 had neurological abnormalities. A motor deficit with a horsetail syndrome was objectified in one case. We noted a biological inflammatory syndrome in 19 cases. Wright’s serology was positive in 21 cases. Standard radiographs showed disc narrowing in 10 cases. 21 patients had spinal magnetic resonance imaging showing the abnormalities of the disc and adjacent vertebrae. We found abscess in four patients and epiduritis associated with the abscess in six patients. MRI showed spinal compression in 2 patients. Disc-vertebral biopsy was performed in 11 cases and helped to make the diagnosis in 3 cases. The patients had received antibiotic therapy with a combination of doxycycline and rifampicin with a mean total duration of 6.2 months (3-8.5 months). The mortality rate was 1.3%.

Conclusion: Brucellar spondylodiscitis can be serious because of the neurological complications that it can cause. At the slightest diagnostic doubt, Brucellar spondylodiscitis can be serious because of the neurological abnormalities. A motor deficit with a horsetail syndrome was objectified in one case. We noted a biological inflammatory syndrome in 19 cases. Wright’s serology was positive in 21 cases. Standard radiographs showed disc narrowing in 10 cases. 21 patients had spinal magnetic resonance imaging showing the abnormalities of the disc and adjacent vertebrae. We found abscess in four patients and epiduritis associated with the abscess in six patients. MRI showed spinal compression in 2 patients. Disc-vertebral biopsy was performed in 11 cases and helped to make the diagnosis in 3 cases. The patients had received antibiotic therapy with a combination of doxycycline and rifampicin with a mean total duration of 6.2 months (3-8.5 months). The mortality rate was 1.3%.

HEPATIC SAFETY OF ANTI-TUBERCULOUS TREATMENT IN SPONDYLODISCITIS

Aicha Ben Tekaya1, Khouloua Zoussou1, Rawdha Tekaya1, Oifa Saidane1, Mohamed Ben Hammania2, Iines Mahmoud1, Leila Abdelmoula1, 1 Charles Nicolle Hospital, Tunis, Tunisia; 1Rafa hospital, Tunis, Tunisia

Background: Tunisia is considered as a country with high tuberculosis endemicity. The anti-tuberculosis treatment is quite long and binding and requires close hepatic monitoring.

Objectives: The purpose of this study was to highlight the hepatic safety of anti-tuberculous treatment in tuberculosis spondylodiscitis.

Methods: This is a retrospective descriptive study, over 20 years (1999-2019) collating cases of tuberculous spondylodiscitis in a rheumatology department. We studied the epidemiological, clinical, radiological and therapeutic aspects.

Results: Our study included 62 patients, 35 women and 27 men. Mean age was 56 years (19-86). The diagnosis delay averaged 5.59 months [0.23-24]. Tubercular contact was noted in 11.3% of the cases. Neurological abnormalities were noted in 16.1% of cases with spine compression in 3.22%. The tuberculin skin test was positive in 29 cases and the Koch bacillus investigations in the sputum and the urine were positive in only 3 patients. Magnetic resonance imaging was performed in 71% of the patients and mainly showed images of disc destruction with images of abscess, epiduritis and epidural extension. Infectious spondylodiscitis affected the lumbar spine in 66.1% of the cases, the dorsal spine in 14.51% of the cases and the cervical spine in 6.55% of the cases. It was bi-staged in 19.35% of the cases and bifocal in 17.74% of the cases.

VALUE OF SERUM PROCALCITONIN FOR THE DIAGNOSIS OF BACTERIAL SEPTIC ARTHRITIS IN DAILY PRACTICE IN RHEUMATOLOGY

Mickaël Chouk1, Frank Verhoeven1, Maxime Sondag1, Xavier Guillot2, Clément Prie1, Daniel Wendling1, 1Centre hospitalier régional universitaire de Besançon, Besançon, France; 2Hospital Center Félix Guayon, Saint-Denis, Reunion Island

Background: Septic arthritis is a diagnostic and therapeutic emergency because of a high morbidity and mortality. Nevertheless, the etiologic diagnosis is often difficult.

Objectives: The aim of our study was to determine if serum procalcitonin was a discriminatory biomarker in case of arthritis of undetermined etiology.

Methods: Patients were separated in 5 groups: gouty arthritis, calcium pyrophosphate deposition arthritis, osteoarthritis or post-traumatic arthritis (“mechanical” arthritis), chronic inflammatory rheumatic arthritis, and septic arthritis. Levels of serum with blood cells, C-Reactive Protein and procalcitonin were measured.

Results: 98 patients were included: 18 in the “gout” group, 26 in the “calcium pyrophosphate deposition arthritis” group, 16 in the “mechanical” group, 18 in the “chronic inflammatory rheumatic” group and 20 in the “sepsis” group. The area under the receiver operating characteristic curve of with blood cells, C-Reactive Protein and procalcitonin levels to diagnose a septic arthritis were 0.69 (IC95% 0.55-0.83), 0.82 (IC95% 0.73-0.91), and 0.87 (IC95% 0.76-0.98) respectively. For a cut-off of 0.5 ng/ml, procalcitonin sensitivity, specificity, positive predictive value, negative predictive value, positive likelihood ratio and negative likelihood ratio were 65%, 91%, 65%, 91%, 7.2 and 0.4, respectively. Serum C-Reactive Protein and procalcitonin levels were correlated, were not different in “sepsis” or “gout” groups and were higher in non-septic arthritis with poly-arthritis than with mono-arthritis (p<0.05).

Conclusion: Serum procalcitonin is a useful biomarker in arthritis management with diagnosis performances higher than those of other biomarkers (with blood cells, C-Reactive Protein).

PNEUMOCOCCAL CELLULITIS AND FASCIITIS IN SYSTEMIC LUPUS ERYTHEMATOSUS: A SYSTEMATIC REVIEW

María Grego1, Hugo Rua-Figueroa1, Antonio Naranjo1, Sabrina Ghiglione2, María Cella Erausquin1, Juan Carlos Quevedo-Abeldeo1, Carlos Rodriguez-Lozano1, Cristina Almeida1, Paola Leon1, Estebal Loza1, 1Hospital Universitario de Canarias Dr. Negrín, Las Palmas, Spain; 2Hospital Universitario de Gran Canaria Dr. Negrín, Las Palmas, Spain; 3Hospital Universitario de Gran Canaria Dr. Negrín, Las Palmas, Spain; 4Hospital Universitario de Gran Canaria Dr. Negrín, Las Palmas, Spain; 5Instituto de Salud Musculoesquelética Iumusc, Madrid, Spain

Background: Streptococcus pneumoniae (SPN) is an encapsulated gram-positive bacterium that can be found in the nasopharynx as part of the normal flora. However, is the most common cause of community-acquired pneumonia in adults and can also cause invasive diseases such as bacteremia, meningitis, and otitis media. Pneumococcal cellulitis and fasciitis
