Conclusion: Our study suggests that the finding of NVC, especially the extent of capillary loss, is correlated with disease process of PAH, even subclinically, and may predict the progression to PAH in SSC. Since NVC is non-invasive, NVC can detect earlier PAH candidates and contribute to the improvement of prognosis.

POTENTIAL BIOMARKERS OF SKIN CHANGES IN SYSTEMIC SCLEROSIS
Radim Běčvář, Hana Storkánová, Barbora Šumová, Maja Šprítová, Sabina Oreska, Ladislav Senolt, Michal Tomčík. Institute of Rheumatology, Prague, Czech Republic

Background: Skin fibrosis is a hallmark of systemic sclerosis (SSc). There are no widely accepted biomarkers of skin involvement in this condition. Several serum or plasma markers have been studied in patients with SSc - monocye chemotactractant protein-1 (MCP-1), chemokine (C-X-C motif) ligand 9 (CXCL9), interleukin-13 (IL-13), and some more recognized such as - platelet derived growth factor (PDGF), transforming growth factor-beta 1 (TGF-beta 1), epidermal growth factor (EGF) and basic fibroblast growth factor (bFGF).

Objective: The aim of this study was to assess several circulating biomarkers which may be relevant to the fibrosing process and further to correlate the obtained data with clinical indicators specific for SSc skin involvement.

Methods: 59 SSc patients (M/F 9/50; mean age 52.1 years, mean disease duration 6.7 years, 36 patients with limited cutaneous SSc and 23 with diffuse cutaneous SSC. As a control group 36 healthy individuals matched to sex and age were examined. Serum concentrations of bFGF, granulocyte-colony stimulating factor (G-CSF), granulocyte-macrophage-colony stimulating factor (GM-CSF), MCP-1, PDGF, IL-8 and 13 were analysed using commercial multiplex kit. The following clinical examinations were performed: modified Rodnan skin score (mRSS), Hand Mobility in Scleroderma Test (assessing hand function) (HAMIS), Cochin Hand Function Scale (hand function) (CHFS), Delta Finger-to-Palm Distance (extension-flexion) (dFTP), Inter-lip Distance (inter-lip), Inter-incisor Distance (inter-incisor), and Mouth Handicap in Systemic Sclerosis Scale (mouth opening) (MHIS). For statistical evaluation Spearman’s correlation coefficient was used.

Results: When compared with healthy controls serum concentrations of bFGF (p<0.001), G-CSF (p<0.0001), GM-CSF (p<0.0001), MCP-1 (p<0.0001), IL-8 (p<0.0001), and IL-13 (p<0.0001) were significantly elevated in SSc cohort. PDGF levels were increased in SSc patients with only a lower significance (p<0.01). bFGF, G-CSF, MCP-1 and IL-8 levels correlated significantly (p<0.05) with mRSS and HAMIS. GM-CSF levels correlated with mRSS and HAMIS and there was only a trend for negative correlation with inter-incisor. The was no correlation of IL-13 and PDGF levels with the evaluated clinical data.

Conclusion: Our results have shown that G-CSF, GM-CSF and IL-8 play a substantial role in SSc fibrosing process. Potential biomarkers as bFGF, G-CSF, MCP-1 and IL-8 correlated with a few clinical indices of SSc skin involvement.

INFLUENCE OF CARDIOVASCULAR RISK FACTORS ON NAILFOLD VIDEOCAPILLAROSCOPY IN THE STUDY OF CONNECTIVE TISSUE DISEASES
Diego Benavent, Laura Nuño, Gemma Bonilla, Diana Peiteado, Charnama Plasencia, Victoria Navarro-Compañ, Irene Monjo, Alejandro Villava, Sara García-Carazo, Carolina Tomero, Patricia Bogas, Elisa Fernández, Miguel Berrad, Ana Castilla, Pilar Aguado, María-Eugenia Miranda-Canos, Eugenio de Miguel, Alejandro Balza. Hospital Universitario La Paz, Madrid, Spain

Background: Nailfold videocapillaroscopy is a non-invasive technique used to assess Raynaud syndrome. It is mainly used for the early diagnosis of connective tissue disorders (CTD) such as systemic sclerosis. There is some evidence that capillaroscopy findings may be altered by microcirculation abnormalities in patients with cardiovascular risk factors (CVRF). Objectives: to analyze the influence of cardiovascular risk factors on nailfold capillaroscopy in patients with Raynaud or suspect of CTD.

Methods: An observational and descriptive study of consecutive patients that underwent a videocapillaroscopy examination for the study of Raynaud syndrome was conducted. A ‘Capiscope’ model videocapillaroscope from Opilia was used, with a fixed magnification of 200x. Examination was made on 8 hand fingers, with 2 images per finger. The patients had to be at least 30 minutes in a fixed warm temperature room and without smoking 1 hour before the performance of the test. The following capillaroscopic parameters were considered: nailfold morphology, capillary loop enlargements, megacapillaries, microhaemorrhages, avascular areas and signs of necangiogenesis. Demographic information (including age, gender and previous diagnosis) and cardiovascular risk factors (including arterial hypertension (HT), diabetes mellitus (DM), dyslipidemia (DL) and smoking habit), were collected. The influence of cardiovascular risk factors on nailfold capillaroscopy was analyzed, using univariate and multivariate logistic regression models, adjusted for possible confounders.

Results: Out of the 136 included patients, 91% were women. Mean age was 54.6 ± 18.7 years. Raynaud syndrome was reported in 83% of patients, with a mean duration of 6.1 ± 5.7 years and 12% of the patients had a previous diagnosis of CTD, including systemic lupus erythematosus (5%), systemic sclerosis (4%), undifferentiated connective tissue disorder (2%) and mixed connective tissue disease (1%). Regarding CVRF, HT was observed in 25%, DM in 7%, DL in 23% and past or current smoking habit in 32%. Capillaroscopic findings were: loop enlargements (81%), megacapillaries (30%), microhaemorrhages (46%), signs of necangiogenesis (71%) and avascular areas (20%).

Regarding the capillaroscopic pattern, 46% presented a normal or non-specific pattern; 31% a microangiopathy pattern and 23% a scleroderma pattern (of which 58% had an early or active scleroderma pattern and 42% a late scleroderma pattern). A new diagnosis of CTD was made in 24 patients (18% of the cohort). In the group of patients without CTD, HT was associated with microhaemorrhages (p = 0.02) and avascular
