REFRACTORY LOW BACK PAIN AND LUMBAR CT-GUIDED STEROID INfiltrATION. STUDY OF 582 PROCEDURES FROM THE SAME CENTER
I. Calvo1, O. Ibaraguengotia2, D. Montero1, L. Vega1, L. Maria1, M. E. Ruiz1, I. Torre1, O. Fernandez1, J. M. Blanco1, A. R. Inchauste2, Clara Perez1, Eduardo Cuende1, F. Diez1, C. Morandeira1, Iñigo Gorostiza1, E. Galindez1, I. Basurto University Hospital, Rheumatology, Bilbao, Spain 2Basurto University Hospital Radiodiagnostic, Bilbao, Spain

Background: Mechanical low back pain which is refractory to analgesic and rehabilitative treatment is an important cause of disability. The primary objective of corticosteroid (CS) lumbar infiltration is to accelerate the recovery process and to avoid surgery. However, its use is not without controversy.

Objectives: To review the indications, efficacy and complications of lumbar computed tomography (CT)-guided CS infiltration.

Methods: Retrospective study (January 2012 - April 2018) of lumbar CT-guided CS infiltrations performed in a single center. The epidemiological variables, underlying pathologies, approach of injection, used CS (dexamethasone during the whole period and triamcinolone until February 2015), efficacy after 1 and 2 months and complications were registered. In addition, a comparative study of the efficacy according to indication, type of CS and approach of injection was performed.

Results: Frequencies and percentages were used in qualitative variables, mean ±SD in quantitative and for the comparison between groups Chi2 test or Fisher test was used in categorical variables and Student T test or U of Mann-Whitney in quantitative. Statistical analysis was performed with IBM SPSS v.23.

Results: 582 procedures were performed in 445 patients (1 infiltration in 445 patients, 2 in 106, 3 in 23, 4 in 7 and 5 in 1). The mean age±SD was 58.6±14.8 years with a male/female ratio of 224/221. Traumatology (445 patients, 2 in 106, 3 in 23, 4 in 7 and 5 in 1). The mean age±SD in quantitative and for the comparison between groups Chi2 test or Fisher test was used in categorical variables and Student T test or U of Mann-Whitney in quantitative.

Results: 582 procedures were performed in 445 patients (1 infiltration in 445 patients, 2 in 106, 3 in 23, 4 in 7 and 5 in 1). The mean age±SD was 58.6±14.8 years with a male/female ratio of 224/221. Traumatology was the service with highest demand (88.8%) followed by rheumatology (4.8%). The indications were disc herniation (43.1%), lumbar spinal stenosis(36.4%), postoperative fibrosis (14.8%), spondylarthrosis (2.7%) and other [lithesis, synovial cyst and facet joint syndrome] (2.8%). Posterior epidural access was performed in 27.1% of the procedures, foraminal in 17.9% and lateral recess in 55%. The used CS were dexamethasone (66.3%) and triamcinolone (33.7%). In 86% of patients the oral analgesic intake was performed in 27.1% of the procedures, foraminal in 17.9% and lateral recess in 55%. The used CS were dexamethasone (66.3%) and triamcinolone (33.7%). In 86% of patients the oral analgesic intake was performed in 27.1% of the procedures, foraminal in 17.9% and lateral recess in 55%. The mean age±SD was 58.6±14.8 years with a male/female ratio of 224/221. Traumatology was the service with highest demand (88.8%) followed by rheumatology (4.8%). The indications were disc herniation (43.1%), lumbar spinal stenosis(36.4%), postoperative fibrosis (14.8%), spondylarthrosis (2.7%) and other [lithesis, synovial cyst and facet joint syndrome] (2.8%). Posterior epidural access was performed in 27.1% of the procedures, foraminal in 17.9% and lateral recess in 55%. The used CS were dexamethasone (66.3%) and triamcinolone (33.7%). In 86% of patients the oral analgesic intake was performed in 27.1% of the procedures, foraminal in 17.9% and lateral recess in 55%.

Results: Only 21% required surgery. Triamcinolone (although its use is currently discouraged because it is a particulate CS), foraminal injection and lateral recess proved to be more effective for pain control.

In this study, lumbar CT-guided CS infiltration in patients with refractory low back pain is an accessible, minimally invasive, safe and effective procedure in long term.

EXTRACORPOREAL SHOCKWAVE VERSUS MUSCULOSKELETAL MESOTHERAPY FOR ACHILLES TENDINOPATHY IN ATHLETES
Reem Elmallah1, Enas Elattar2. 1Faculty of medicine Ain Shams University, Assistant Professor of Physical Medicine, Rheumatology and Rehabilitation, Cairo, Egypt 2Faculty of Medicine, Ain Shams University, Assistant Professor of Physical Medicine, Rheumatology and Rehabilitation, Cairo, Egypt

Background: Achilles tendinopathy (AT) is considered as one of the common tendonopathies, which occurs mainly in athletes. Different conservative treatment options have been introduced and used for symptoms relief of AT but with short-term effect.1 Extracorporeal shockwave treatment (ESWT) provides longer effects and could be used in cases fail to respond to conservative treatment.2 Mesotherapy is widely practiced in sports medicine as multiple injections, often of anti-inflammatory medications into the subcutaneous fat overlying a region of musculoskeletal pain. The effect appears unclear but may be due to localized tissue uptake of anti-inflammatory medication which may provide symptomatic relief especially in insertion Achilles tendinopathy 3

Objectives: In this study, we aimed to evaluate the effect of extracorporeal shockwave treatment (ESWT)and mesotherapy on chronic Achilles tendinopathy in athletes

Methods: 40 patients with chronic AT were diagnosed clinically & using high resolution ultrason (US) according to the Eular guide lines and randomly allocated in two groups, first receive ESWT, other group underwent mesotherapy (MT) one session once a week for 4 weeks to the 2 groups. Pain, ankle-hindfoot scale of the American Orthopedic Foot and Ankle Society (AOFAS) 4 & US were recorded at baseline, 4 and 12 weeks after intervention

Results: Both groups improved during the treatment and follow-up period. The mean VAS score decreased from 7.55 to 3 in the ESWT group and from 7.70 to 4.30 in MT group. There was no significant difference in terms of AOFAS and VAS scores between both groups at 4 weeks follow up while Mean AOFAS & VAS scores were significantly different between ESWT and MT groups at 12 weeks of follow-up (P = 0.013) (P = 0.47). US assessment significantly improved after 12 weeks in ESWT group as regards tendon thickness, calcifications and doppler signal.

Conclusion: ESWT showed improvement of pain and inflammation of AT than MT injections which was documented by the decreased VAS, increased AOFAS scores as well as US improved findings shortly after the treatment as well as on late follow up.

Figure 1
The role of bisphosphonates in the treatment of SONK is debated and the useful effect of alendronate in the prevention of early collapse of the osteonecrosis identified on imaging. Lai et al (2005) demonstrated the beneficial effect of alendronate in the prevention of early collapse of the femoral head in patients with nontraumatic osteonecrosis. However, the role of bisphosphonates in the treatment of SONK is debated and the evidence is based upon a few studies. The following references are cited:

EFFECT OF VITAMIN D SERUM CONCENTRATION ON ARTHRITIS INDUCED BY ADJUVANT THERAPY WITH AROMATASE INHIBITORS IN NON METASTATIC BREAST CANCERS SURVIVORS

Emmanuele Cotelli, Carlotta Schenone, Francesco Cattelan, Elisa Alessandri, Federica Goegan, Massimo Patané, Massimo Ghio, Maurizio Cutolo, Sabrina Paolino. IRCCS San Martino Polyclinic Hospital, Genova, Italy, Research Laboratory and Academic Division of Clinical Rheumatology, Department of Internal Medicine, University of Genova, genova, italy

Background: Hand arthralgia is often reported by breast cancer patients treated with adjuvant hormonal therapy. Aromatase inhibitors (AIs) improve survival in postmenopausal women with hormone-sensitive breast cancer, but can cause joint pain and stiffness (2). Low concentration of vitamin D in adults can cause musculoskeletal pain and joint discomfort (1). No data are available to date, on serum concentrations of (25-hydroxyvitamin D) [25 (OH) D3] vitamin D in Al-treated patients and possible relationship with arthralgia.

Objectives: To evaluate possible correlation between different 25 (OH) D3 serum concentrations and hand arthralgia in patients with breast cancer treated with AIs.

Methods: All patients that during the AIs therapy develop arthralgia were referred to the rheumatologist; they reported the pain following the VAS (visual analogic scale) and contemporary performed a sample blood for dosage of vitamin D as well as biomarkers for inflammation and autoimmunity to exclude concomitant immune/inflammatory rheumatic musculoskeletal causes.

Results: In a group of 63 women taking AIs (mean age 62.3±9.8years; disease duration from first assumption of AIs 10.6±3.2 months) 81% reported hand arthralgia and stiffness within the first year of follow-up; the most prevalent site of pain localization was bilateral hands (85%). Symptom was associated with minimal increase of serum parameters of inflammation (the mean value of C-reactive protein was 7.1±3.0 mg/L) [25 (OH) D3] vitamin D serum levels, 70% were insufficient (≥ 10 < 20 ng/mL), and 21% were severely deficient (< 10 ng/mL). 55% of patients started AIs after chemotherapy. From the group that received AIs after chemotherapy 77% patients with arthralgia were found during the first years of hormonal therapy, in the group that previously did not take chemotherapy 88% of patients referred arthralgia. There was any
