Mease5, 1University of Copenhagen, Copenhagen, Denmark; 2University of Alberta, Edmonton, Canada; 3Bispebjerg and Frederiksberg Hospital, Copenhagen, Denmark; 4Image Analysis Group, London, United Kingdom; 5Celanese Corporation, Summit, United States of America

**Background:** Phase III clinical trials have shown apremilast (APR) reduced PsA signs/symptoms and improved physical function,1,2 but no study has addressed its impact on structural disease progression. MRI is a highly sensitive, validated tool to assess inflammatory and structural changes, as it can detect soft tissue inflammation, bone marrow edema (BME) lesions, bone erosion and proliferation in peripheral joints and axial skeleton. Whole-body (WB)-MRI, a relatively novel technique in musculoskeletal studies, allows assessment of all peripheral/axial joints and entheses in 1 examination.3 Recent, consensus-based and semi-quantitative scoring methods were developed and validated. This study is the first to systematically use new state-of-the-art MRI scoring methodologies to assess PsA inflammatory and structural changes in a global clinical trial.

**Objectives:** To assess APR efficacy on inflammatory indices and imaging outcome measures associated with PsA structural progression by conventional static MRI and dynamic contrast-enhanced (DCE)-MRI of the most affected hand and WB-MRI.

**Methods:** The study aims to enroll 120 biologic-naive adults with PsA for ≤3 mos to ≥5 yrs and prior treatment with ≤2 conventional DMARDs. Subjects must have ≥3 swollen and ≥3 tender joints, hand involvement (≥1 swollen joint or ≥1 dactylitis) and ≥1 active enthesitis site. After 4-wk screening, all eligible patients will receive APR 30 mg twice daily (titrated during the first 5 days) as monotherapy or in combination with methotrexate for 48 wks, with a 4-wk observational follow-up. Conventional MRI and optional DCE-MRI of the most affected hand and WB-MRI of the entheses will be performed at Wks 0, 24 and 48. The primary endpoint is change from BL to WK 24 in OMERACT PsA MRI composite score (BME + synovitis + tenosynovitis). Other imaging endpoints include change from BL to WK 48 in PsAMRIS composite score (BME + synovitis + tenosynovitis) and change from BL to Wks 24 and 48 in PsAMRIS composite score (BME + synovitis + tenosynovitis + periarticular inflammation). PsAMRIS total damage score (erosion + bone proliferation), WB-MRI indices (including peripheral joint inflammation index and peripheral enthesis inflammation index), hip and knee inflammation MRI scores (HIMRIS, KIMRIS), OMERACT heel enthesis MRI indices, axial inflammation indices (SPARC, CanDen), DERMIVolume and DERMIQ-Inflammation and other DCE-MRI-derived parameters. Clinical parameters will include SJC/TC, cDAPSA, SPARC Enthesitis Index, Leuds Enthesis Index, Leuds Dactylitis Index, PASDAS, PsGQA, PsGA, Patient’s Assessment of Pain, HAQ-DI, and BASDAI and impact of disease (PsAID12). Safety and tolerability also will be assessed.

**Results:** The study protocol was approved by an independent ethics committee and is now enrolling in the USA. Selected countries in Europe and Russia will also participate. MRI, clinical and patient-reported outcomes will be analyzed.

**Conclusion:** This study will provide important evidence of APR’s impact on inflammatory/structural changes by assessing all PsA musculoskeletal domains (peripheral arthritis, enthesis, dactylitis and axial disease). Furthermore, it will yield information on use of conventional MRI-, WB-MRI- and DCE-MRI-driven outcome measures in PsA clinical trials.

**COMPUTER-BASED EVALUATION OF JOINT SPACE NARROWING IN PATIENTS WITH PSORIATIC ARTHRITIS TREATED WITH CERTOLIZUMAB PEGOL**

Alexander Pfeil1, Anica Nussbaum1,2, Diane Renz3, Ansgar Malich1

1University of Ulm, Ulm, Germany; 2University of Alberta, Edmonton, Canada; 3Suedharz Klinikum Nordhausen, Institute of Diagnostic and Interventional Radiology, Nordhausen, Germany; 4SRH Waldklinikum Gera, Institute of Diagnostic and Interventional Radiology, Gera, Germany

Background: The reduction of joint space width in patients with rheumatoid arthritis (RA) is associated with joint destruction. Anti-TNF treatment with certolizumab pegol is an effective therapy in RA-patients. The computer-assisted joint space analysis is a new computer based technique to measure joint space width on hand radiographs.

**Objectives:** The aim of this post-hoc analysis of the data set used in the RAPID 1 trial was to quantify finger joint space width of RA patients treated with Certolizumab pegol.

**Methods:** The post-hoc analysis includes 328 patients. These patients were divided into three groups: methotrexate plus placebo, certolizumab pegol 200 mg (every two weeks) plus methotrexate, and certolizumab pegol 400 mg (every two weeks) plus methotrexate. All patients underwent x-rays of the hand at baseline and week 52 as well as the quantification of finger joint space width of the metacarpal-phalangeal articulations (MCP) using the computer-assisted joint space analysis (Version 1.3.6; Sectra; Sweden). The joint space distance is expressed as mean joint space width of the MCP joints I to V (JSD-MCP total).

**Results:** The methotrexate group presented a significant joint space reduction with -4.8% for JSD-MCP total from 0.151 ± 0.028 cm (baseline) to 0.144 ± 0.033 cm (week 52). For the patients treated with certolizumab pegol 200 mg a significant reduction of JSD-MCP total from 0.146 ± 0.034 cm (baseline) to 0.147 ± 0.036 cm (week 52) was observed. A similar result was evaluated for the certolizumab pegol 200 mg group (JSD-MCP total: 0.147 ± 0.035 cm [baseline] to 0.147 ± 0.036 cm [week 52]).

**Conclusion:** The study highlights that patients treated with certolizumab pegol plus methotrexate show no change of joint space width of the metacarpal-phalangeal articulations in comparison to patients with methotrexate plus placebo estimated by computer-assisted joint space analysis. Consequently, the automatic quantification of finger joint space is on a sensitive technique for the quantification of joint space reduction and treatment monitoring.
