AB0868-HPR ADHERENCE TO DISEASE-MODIFYING ANTIRHEUMATIC DRUGS IN RHEUMATIC DISEASES DURING COVID-19 PANDEMIC

I. A. Moreno-Arquie¹, G. G. Sánchez Mendieta¹, D. E. Flores Alvarado¹, J. A. Esquivel Valerio¹, D. Á. Galarza-Delgado¹, ¹Dr. José Eleuterio González (Gonzalitos) 235, Rheumatology, Monterrey, Mexico

Background: The pandemic COVID-19 has set a new challenge in adherence to treatment in patients with rheumatic diseases. Prior studies in Latin America had reported adherence of 16.4% on Rheumatoid Arthritis (RA) and 45.9% in Systemic Lupus Erythematosus (SLE). There is evidence that these patients believe their treatment increases the risk and gravity of COVID-19 and therefore, suspending the treatment could reduce this risk. It has been shown that a "Good adherence" is associated to a better survival.

Objectives: Describe the adherence to DMARDs in patients with Rheumatic diseases during COVID-19.

Methods: Descriptive, cross-sectional, self-report study conducted in rheumatology outpatient clinic of University Hospital in Monterrey, México. Consecutive patients with RA, SLE, Inflammatory Myopathies and Systemic Sclerosis, were approached during their routine appointments, March 2020 to December 2020 period during COVID-19 pandemic. They were asked how many days of the month they took the DMARD indicated in the previous appointment, with Based on this, adherence was classified into four categories: Good 100-75% (> 21 days), Regular 74-50% (21-15 days), Bad 49-25% (14-8 days) and Null <25% (<7 days). Data was obtained from our internal electronic patient record registry and analyzed with SPSS V.22.

RESULTS:

	n (DMARDs)	Good	Regular	Bad	Null
		n (%)	n (%)	n (%)	n (%)
Rheumatoid Arthritis	302	255 (84.4)	13 (4.3)	20 (6.6)	14 (4.6)
Systemic Lupus Erythematosus	126	111 (88)	3 (2.3)	8 (6.3)	4 (3.1)
Inflammatory Myopathies	11	10 (90.9)	0 (0)	1 (9)	0 (0)
Systemic Sclerosis	30	27 (90)	2 (6.6)	1 (3.3)	0 (0)
TOTAL	469				

Conclusion: Despite what it is believed, patients are not changing therapeutic regimes. The adherence found in this group of patients was good, for the definition used in this study. It should be considered that the self-report method may overestimate adherence, so the data found must be correlated with objective methods in the future.

AB0869-HPR HOW TO IMPROVE THE QUALITY-OF-LIFE IN PATIENTS WITH OSTEOPOROSIS?

A. Lammert¹, S. Lezhenina¹, N. Shuvalova², N. Andreeva¹, E. Guryanova³, ¹I. N. Ulianov Chuvash State University, Department of Healthcare Management and Economics, Cheboksary, Russian Federation; ²I. Ya. Yakovlev Chuvash Pedagogical State University, Department, Cheboksary, Russian Federation; ³I. N. Ulianov Chuvash State University, Department Internal Diseases, Cheboksary, Russian Federation

Background: This paper is an assessment of quality-of-life for patients living with osteoporosis. It employs special questionnaires and scales to allow for more detailed observation of the patient both during initial treatment and in dynamics. This allows us to establish the effectiveness of the therapy, to assess the need to correct the treatment and rehabilitation program, and to compare the effectiveness of various treatment methods and determine disease prognosis.

Objectives: to assess quality-of-life in patients with osteoporosis for further development of treatment and rehabilitation programs.

Methods: To assess the quality-of-life in patients with osteoporosis, HRQOL and SF-36 scale were used. The study was conducted from January to December 2019, at the Republican Clinical Hospital of the Chuvash Republic. The study involved 70 patients (n = 70) with a diagnosis of osteoporosis with a pathological fracture. Of the 70 patients included in the study, 35 women aged 67 ± 1.2 years and 35 men aged 60 ± 1.2 years. The results were statistically processed using MS Office Excel programs.

Results: According to the analysis carried out by the HRQOL method, more than half of the patients (52.13%) experienced daily back pain, which worsens their mood and well-being. When assessing the degree of pain, almost half of the patients (48.73%) rated their pain by VAS as moderate. Moreover, most of the respondents experienced a "significant" (46.51%) or "moderate" (34.29%) decrease in social activity due to pain syndrome associated with osteoporosis. In connection with this, 44.51% rated their satisfaction with their lives as "average degree of satisfaction".

When analyzing the quality-of-life indicators according to the SF-36 scales, we determined that the mental component of health predominates for women (The Short Form-36: MH=68.6±3.45 (Men: MH=48.5±2.85)). In men, high quantitative values of the scales "physical" and "role physical functioning" (The Short Form-36: PF=62.5±3.33; RP=58.4±3.81) indicate a more pronounced nature of changes in somatic status, which has a significant impact on the quality-of-life. The intensity of pain was perceived to be higher by men (The Short Form-36: BP=75.6±4.06) than by women (The Short Form-36: BP=35.7±1.86). This confirms that osteoporosis and its complications negatively affect the human psyche and can significantly worsen the quality-of-life.

Conclusion: Analysis of quality-of-life indicators using the SF-36, HRQOL method contributes to a more correct choice of effective strategy for specialized medical care and rehabilitation for patients with osteoporosis. This choice should be developed individually, taking into account the age, gender characteristics, the severity of structural and functional disorders and the psychological state of the patient. It must also take into account the presence and severity of concomitant diseases, which will require additional research and discussion at different levels of the organization of medical care.

AB0870-HPR GLOBAL TRENDS IN PRP AND OSTEOARTHRITIS: A BIBLIOMETRIC AND VISUALIZED STUDY

Y. Qiu¹, Y. Zhang¹, L. Wen¹, ¹Beijing Hospital, National Center of Gerontology, Department of Orthopedic, Beijing, China

Background: Osteoarthritis (OA) is a serious disease, which is one of the main causes of joint pain and body dysfunction, raising serious economic and social burden. In recent years, there are tremendous articles on the treatment of osteoarthritis, platelet rich plasma (PRP) is one of the new trends in the treatment of osteoarthritis.

Objectives: The purpose of this study is to explore the development trend of PRP related osteoarthritis study and grasp the hot spots and directions in this field.

Methods: Publications focusing on PRP related osteoarthritis research from 2001 to 2020 were retrieved from Web of Science (WoS) and Science Citation Index-Expanded (SCIE) database. The retrieving methods were as follow: (theme = platelet rich plasma arthritis OR theme = platelet rich plasma osteoarthritis OR theme = platelet rich plasma cartilage OR theme = platelet rich plasma knee OR theme = platelet rich plasma orthopedic OR theme = platelet rich plasma orthopaedic OR theme = platelet rich plasma articular OR theme = platelet rich plasma joint OR theme = platelet rich plasma tendon). Publications were analyzed only when type is articles or reviews. The VOS viewer was used for the generation of bibliographic coupling and visualized study.
