**Figure S1** Mean HAQ-DI scores by treatment group from baseline to week 26 (PP population).

Least squares means calculated from the repeated measures linear mixed model; per protocol population where patients were excluded (censored) from the analysis following the day where they were categorised as treatment failures. Bars indicate 95% confidence intervals. Health Assessment Questionnaire Disability Index (HAQ-DI) score, range from 0 to 3, with higher scores indicating greater disability. FMT, faecal microbiota transplantation.
